HELP

Change the detected species

Validate, correct or reject the species suggested by the AI on a photo, and check after the dive what the camera recognised.

Updated on 19 November 2026

Written with the help of an AI

What it is for

The AI suggests, you decide. Only the species you validate or correct count as **Validated species** of the session.

Before you start

- Be signed in, on one of your own sessions.
- For a photo: the AI analysis must be finished (see “Analyse a photo”).

On a photo, from the iPhone

1. Open the session, then tap **AI analysis** on the photo.
2. For each fish in the list, choose an action:

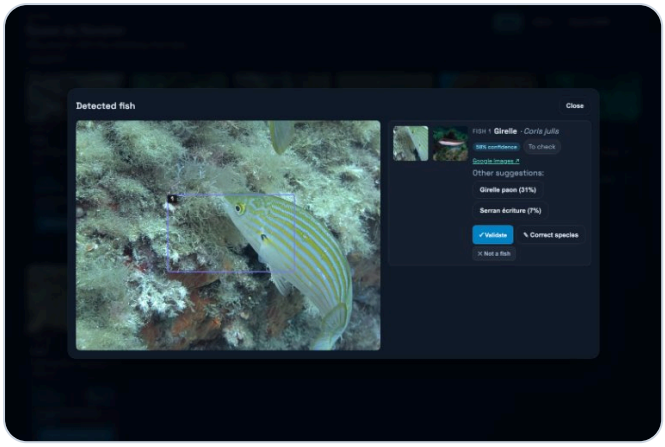
Button	Effect
Validate	You confirm the suggested species.
Correct species	You choose another species.
Not a fish	The box is marked as a false positive.
Undo check	You undo your check.

1. If the right species is listed under **Other suggestions:**, tap it: the correction is done in one gesture.
2. Otherwise, tap **Correct species**, type a name in **Search a species** and choose in the list. If the species is not there, tap **Use “your text”** to keep the name you typed.
3. Close the window. The checked species appear in the **Validated species** section of the session.

On a photo, from the web space

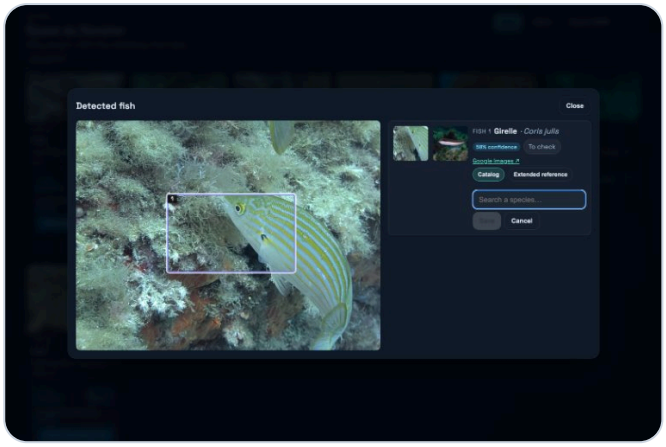
1. In the **Media** tab of the session, click **Check fish one by one**.
2. Use **Validate**, **Correct species**, **Not a fish** or **Undo check**.
3. When correcting, search in **Catalog** or in **Extended reference**, then click **Save**. If nothing matches, the name you typed is kept.

Detected fish with other species suggestions



Reefwise

Species search to correct the detection



Reefwise

There is no fish on the photo

- **iPhone**: in the **AI analysis** section, tap **No fish on this image**, then confirm.
- **Web space**: ⋯ menu of the photo, **No fish**. There is no confirmation.

The species and the checks of this photo are then removed from the session.

What the camera recognised during the dive

The species recognised live during a **New Session** can be checked afterwards.

1. Open the session and go to the **Camera detections** section.
2. For each detection, tap **Confirm**, **Correct** or **Not this fish**. The other suggestions can be chosen in one gesture.
3. On the iPhone, these checks are saved on the device: sync the session to send them.

In the web space, the same block is in the **Info** tab of the session.

Good to know

- While an analysis is running on the photo, the check is refused: “An analysis is running on this photo. Try again in a moment.”
- A new analysis of the photo archives your previous checks.
- The **Good**, **Not good** and **Reanalyze** buttons of a photo send feedback to the Reefwise team. **Reanalyze** is a request: it does not run the analysis again immediately, and you are told when it has been handled.

> When in doubt between two species, leave the fish “To review” rather than validating at random. You can come back to it after checking the catalogue or asking an instructor.

Going further

A photo that is too blue makes identification difficult: see “Optimise a photo”.
